Contents

1 Advanced algorithms

1.1	2-SAT problem	1
1.2	Closest pair problem	2
1.3	Iterative deepening A* (IDA*)	2
1.4	Lowest common ancestor (LCA)	3
1.5	Suffix automaton	4

2 Dynamic programming algorithms

2.1	0-1 knapsack	4
2.2	Longest common subsequence (LCS)	5
2.3	Max 2D range sum	5
2.4	Traveling salesman problem (TSP)	5

3 Graph algorithms

3.1	All-pairs shortest paths (APSP)	6
3.2	Bipartite matching BFS by David	6
3.3	Centroid decomposition	6
3.4	Detect negative weight cycle	7
3.5	DFS	7
3.6	DFS ICPC 2019 Russia problem E	8
3.7	Dijkstra by Bill	8
3.8	Dijkstra by David	8
3.9	Print Euler tour	9
3.10	Find articulation points and bridges for undirected graph	9
3.11	Floyd Warshall by David	9
3.12	Graph edges property check	10
3.13	Kruskal by David	10
3.14	Max flow	10
3.15	Max cardinality bipartite matching (MCBM)	10
3.16	Max cardinality matching (MCM)	11
3.17	Max weight perfect bipartite matching	12
3.18	Min-cost flow (MCF)	13
3.19	Minimum spanning tree (MST)	13
3.20	Strongly connected component (SCC)	13

4 Greedy algorithms

4.1	Interval covering	14
4.2	Longest increasing subsequence (LIS)	14
4.3	Max 1D range sum	15

5 Math algorithms

5.1	Chinese remainder theorem	15
5.2	Extended greatest common divisor (Ext-GCD)	15
5.3	Greatest common divisor (GCD) and least common multiple (LCM)	15
5.4	Generate list of prime numbers	15
5.5	N choose R combination (nCr)	16
5.6	Stirling's approximation	16

6 String algorithms

6.1	Knuth Morris Pratt (KMP)	16
6.2	Longest palindromic substring	16
6.3	Minimum edit distance	16
6.4	Z-algorithm	17

7 Data structures

7.1	Union-find disjoint sets (UFDS) by David	17
7.2	Binary indexed/fenwick tree (BIT)	18
7.3	Rope	18
7.4	Segment tree	18
7.5	Suffix array	19
7.6	Suffix tree	20
7.7	Trie	20
7.8	Union-find disjoint sets (UFDS) by Bill	21

8 Utilities

8.1	Bit manipulation	21
8.2	C++ input output	21
8.3	C++ STL	21
8.4	Dates	22
8.5	Prime numbers	22
8.6	Theorems	22

}

```

2.4 Traveling salesman problem (TSP)

```

// This is a solution for UVa 10496 - Collecting Beepers. The problem is a
// variant of the Traveling Salesman Problem (TSP): Given n cities and their
// pairwise distances in the form of a matrix 'dist' of size n * n, compute the
// minimum cost of making a tour that starts from any city s, goes through all
// the other n - 1 cities exactly once, and finally returns to the city s. In

```

```
// this case, the salesman is Karel in a 2D world who can only move along the
// x and y axis. The cities are beepers whose coordinates are given, from which
// pairwise distances can be calculated. Algorithm takes time  $O(2^n \cdot n^2)$ .
// INPUT: The first line is the number of test cases. The first line of each
// test case is world's size (x-size and y-size). Next is the starting position
// of Karel. Next is the number of beepers. Next are the beepers' x- and y-
// coordinates.
// OUTPUT: For each test case, output the minimum distance to move from Karel's
// starting position to each of the beepers and back to the starting position.

#include <bits/stdc++.h>

    {
        if ( !isSameSet(i, j) )
        {
            int x = findSet(i);
            int y = findSet(j);
            if (rank[x] > rank[y]) p[y] = x;    // rank keeps the tree short
            else

```

```

        {
            p[x] = y;
            if (rank[x] == rank[y]) ++rank[y];
        }
    }
private:
    vi p, rank;
};

```

8 Utilities

8.1 Bit manipulation

```

#define isOn(S, j) (S & (1<<j))
#define setBit(S, j) (S |= (1<<j))
#define clearBit(S, j) (S &= ~(1<<j))
#define toggleBit(S, j) (S ^= (1<<j))
#define lowBit(S) (S & (-S))
#define setAll(S, n) (S = (1<<n)-1)

```

8.2 C++ input output

```

#include <iostream>
#include <iomanip>

using namespace std;

int main()
{
    // Output a specific number of digits past the decimal point,
    // in this case 5
    cout.setf(ios::fixed); cout << setprecision(5);
    cout << 100.0/7.0 << endl;
    cout.unsetf(ios::fixed);

    // Output the decimal point and trailing zeros
    cout.setf(ios::showpoint);
    cout << 100.0 << endl;
    cout.unsetf(ios::showpoint);

    // Output a '+' before positive values
    cout.setf(ios::showpos);
    cout << 100 << " " << -100 << endl;
    cout.unsetf(ios::showpos);

    // Output numerical values in hexadecimal
    cout << hex << 100 << " " << 1000 << " " << 10000 << dec << endl;
}

```

8.3 C++ STL

```

// Example for using stringstream and next_permutation

#include <algorithm>
#include <iostream>
#include <sstream>
#include <vector>

using namespace std;

int main(void) {
    vector<int> v;

    v.push_back(1);
    v.push_back(2);
    v.push_back(3);
    v.push_back(4);

    // Expected output: 1 2 3 4
    //                  1 2 4 3
    //                  ..
    //                  4 3 2 1
    do {
        ostringstream oss;
        oss << v[0] << " " << v[1] << " " << v[2] << " " << v[3];

```

```

// for input from a string s,
//   stringstream iss(s);
//   iss >> variable;

cout << oss.str() << endl;
} while (next_permutation (v.begin(), v.end()));

v.clear();

v.push_back(1);
v.push_back(2);
v.push_back(1);
v.push_back(3);

// To use unique, first sort numbers. Then call
// unique to place all the unique elements at the beginning
// of the vector, and then use erase to remove the duplicate
// elements.

sort(v.begin(), v.end());
v.erase(unique(v.begin(), v.end()), v.end());

// Expected output: 1 2 3
for (size_t i = 0; i < v.size(); i++)
    cout << v[i] << " ";
cout << endl;
}

```

8.4 Dates

```

// Routines for performing computations on dates. In these routines,
// months are expressed as integers from 1 to 12, days are expressed
// as integers from 1 to 31, and years are expressed as 4-digit
// integers.

#include <iostream>
#include <string>

using namespace std;

string dayOfWeek[] = {"Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun"};

// converts Gregorian date to integer (Julian day number)
int dateToInt (int m, int d, int y){
    return
        1461 * (y + 4800 + (m - 14) / 12) / 4 +
        367 * (m - 2 - (m - 14) / 12 * 12) / 12 -
        3 * ((y + 4900 + (m - 14) / 12) / 100) / 4 +
        d - 32075;
}

// converts integer (Julian day number) to Gregorian date: month/day/year
void intToDate (int jd, int &m, int &d, int &y){
    int x, n, i, j;

    x = jd + 68569;
    n = 4 * x / 146097;
    x -= (146097 * n + 3) / 4;
    i = (4000 * (x + 1)) / 1461001;
    x -= 1461 * i / 4 - 31;
    j = 80 * x / 2447;
    d = x - 2447 * j / 80;
    x = j / 11;
    m = j + 2 - 12 * x;
    y = 100 * (n - 49) + i + x;
}

// converts integer (Julian day number) to day of week
string intToDay (int jd){
    return dayOfWeek[jd % 7];
}

int main (int argc, char **argv){
    int jd = dateToInt (3, 24, 2004);
    int m, d, y;
    intToDate (jd, m, d, y);
    string day = intToDay (jd);

    // expected output:
    //   2453089
    //   3/24/2004
    //   Wed

```

```

cout << jd << endl
<< m << "/" << d << "/" << y << endl
<< day << endl;
}

```

8.5 Prime numbers

```

// Primes less than 1000:
//   2   3   5   7   11  13  17  19  23  29  31  37

//   The largest prime smaller than 100000000000000000 is 9999999999999989.

```

8.6 Theorems

Euler path/tour theorems: An Euler path is a path that visits every edges exactly once. An Euler tour is an Euler path that starts and ends at the same vertex. A graph is an Eulerian-tour graph (i.e. it has an Euler tour) iff all of its vertices has even degrees. A graph is an Eulerian-path graph (i.e. it has an Euler path) iff all but 2 of its vertices has even degrees.

Euler's handshaking lemma: A graph does not have an Euler tour iff it has an even number of vertices of odd degrees.

Bipartite graph related theorems:

- (1) Min vertex cover (MVC) = Max cardinality bipartite matching (MCBM).
- (2) Max independent set (MIS) = $V - \text{MCBM}$.
- (3) The number of spanning tree of a complete bipartite graph $K(n, m)$ is $m^{n-1} * n^{m-1}$.

Cayley's formula: There are n^{n-2} spanning trees of a complete graph with n 1-labeled vertices.

Derangement: A permutation of the elements of a set such that none of the elements appear in their original position. The number of derangements 'der(n)' can be computed as follow: $\text{der}(n) = (n-1) * (\text{der}(n-1) + \text{der}(n-2))$ where $\text{der}(0) = 1$ and $\text{der}(1) = 0$.

Erdos Gallai's theorem: A necessary and sufficient condition for a finite sequence of natural numbers is the degree sequence of a simple graph. A sequence of non-negative integers $d_1 \geq d_2 \geq \dots \geq d_n$ can be the degree sequence of a simple graph on n vertices iff

- (1) $\sum_{i=1}^n d_i$ is even, and
- (2) $\sum_{i=1}^k d_i \leq k * (k-1) + \sum_{i=k+1}^n \min(d_i, k)$ holds for $1 \leq k \leq n$.
