  if( j >= weight[i]*tmp )
          bag[j][1] = max(bag[j-weight[i]*tmp][0] + value[i]*tmp, bag[j][0]);
      for(int j = 0; j < W; j++)
        bag[j][0] = bag[j][1];
// inf
void Unlimited(){
  memset (bag, 0, sizeof (bag));
  for(int i = 0 ; i < N ; i++ ) {
  for(int j = 0 ; j < W ; j++ )</pre>
      if( j >= weight[i] )
        bag[j][1] = max( bag[j][0] ,bag[j-weight[i]][1] + value[i] );
    for (int j = 0; j < W; j++)
      bag[j][0] = bag[j][1];
```

2.2 Longest common subsequence (LCS)

```
#include <iostream>
#include <bits/stdc++.h>
#define LOCAL
using namespace std;
struct LCS{
    int step , max_len ;
}Dp[5000][5000];
int main()
#ifdef LOCAL
freopen("in1.txt" , "r" , stdin );
#endif // LOCAL
    int intX , intY , Min_step , Max_len ;
    string strX , strY ;
    while(cin >> intX >> strX >> intY >> strY ) {
        for(int i = 0 ; i <= intY ; i++) {</pre>
            Dp[0][i].max\_len = 0 ;
            Dp[0][i].step = i ;
        for(int i = 0 ; i <= intX ; i++) {
            Dp[i][0].max\_len = 0 ;
            Dp[i][0].step = i ;
        Max len = 0;
        Min step = 0;
```

2.3 Max 2D range sum

```
// Max 2D Range Sum - UVa 108 - solved with DP O(n^4).
// Abridged problem statement: Given an n x n square matrix of integers A where
// each integer ranges from [-127...127], find a sub-matrix of A with the maximum
#include <bits/stdc++.h>
using namespace std;
int A[200][200];
int main() {
  int n; scanf("%d", &n);
                                                                 // square matrix size
   for (int i = 0; i < n; ++i)
  for (int j = 0; j < n; ++j) {</pre>
       scanf("%d", &A[i][j]);
if (i > 0) A[i][j] += A[i-1][j];
                                                                 // add from top
        if (j > 0) A[i][j] += A[i][j-1];
                                                                 // add from left
         \textbf{if} \ (\texttt{i} \ > \ 0 \ \&\& \ \texttt{j} \ > \ 0) \ A[\texttt{i}][\texttt{j}] \ -= \ A[\texttt{i}-1][\texttt{j}-1]; // \ avoid \ double \ count 
                                                                 // inclusion-exclusion
   int maxSubRect = -127+100+100
                                                                 // the lowest possible val
  int maxSubRect = -12'*100*100;
for (int i = 0; i < n; ++i)
for (int j = 0; j < n; ++j)
for (int k = i; k < n; ++k)
for (int l = j; l < n; ++l)
int subRect = A[k][1];</pre>
                                                                 // start coordinate
                                                                 // end coord
                                                                // from (0, 0) to (k, 1)
             if (i > 0) subRect -= A[i-1][1];
             if (j > 0) subRect -= A[k][j-1];
             if (i > 0 && j > 0) subRect += A[i-1][j-1]; // O(1)
             maxSubRect = max(maxSubRect, subRect); // the answer is here
   printf("%d\n", maxSubRect);
   return 0;
```

2.4 Traveling salesman problem (TSP)

```
// This is a solution for UVa 10496 - Collecting Beepers. The problem is a
// variant of the Traveling Salesman Problem (TSP): Given n cities and their
// pairwise distances in the form of a matrix 'dist' of size n \, * \, n, compute the
// minimum cost of making a tour that starts from any city s, goes through all
// the other n - 1 cities exactly once, and finally returns to the city s. In
// this case, the salesman is Karel in a 2D world who can only move along the
// x and y axis. The cities are beepers whose coordinates are given, from which
// pairwise distances can be calculated. Algorithm takes time O(2^n * n^2).
// INPUT: The first line is the number of test cases. The first line of each
// test case is world's size (x-size and y-size). Next is the starting position
// of Karel. Next is the number of beepers. Next are the beepers' x- and y-
// OUTPUT: For each test case, output the minimum distance to move from Karel's
// starting position to each of the beepers and back to the starting position.
#include <bits/stdc++.h>
using namespace std;
#define LSOne(S) ((S) & -(S))
const int MAX n = 11:
int dist[MAX_n] [MAX_n], memo[MAX_n] [1<<(MAX_n-1)]; // Karel + max 10 beepers</pre>
int dp(int u, int mask) {
                                                  // mask = free coordinates
  if (mask == 0) return dist[u][0];

                                          967
     The largest prime smaller than 10 is 7.
      The largest prime smaller than 100 is 97.
     The largest prime smaller than 1000 is 997.
     The largest prime smaller than 10000 is 9973.
The largest prime smaller than 10000 is 99791.
The largest prime smaller than 100000 is 999983.
The largest prime smaller than 10000000 is 9999991.
     The largest prime smaller than 100000000 is 99999989. The largest prime smaller than 1000000000 is 999999937.
      The largest prime smaller than 10000000000 is 9999999967.
      The largest prime smaller than 10000000000 is 99999999977.
      The largest prime smaller than 100000000000 is 99999999999999.
      The largest prime smaller than 1000000000000 is 999999999971.
      The largest prime smaller than 1000000000000 is 9999999999973.
      The largest prime smaller than 100000000000000 is 99999999999937.
      The largest prime smaller than 100000000000000 is 999999999999997.
