# 1 Dynamic programming algorithms

### 1.1 Longest common subsequence (LCS)

```
#include <iostream>
#include <bits/stdc++.h>
#define LOCAL
using namespace std;

struct LCS{
   int step , max_len ;
}Dp[5000][5000];

int main()
```

```
#ifdef LOCAL
    freopen("in1.txt" , "r" , stdin );
#endif // LOCAL
    int intX , intY , Min_step , Max_len ;
    while(cin >> intX >> strX >> intY >> strY ) {
         for(int i = 0 ; i <= intY ; i++) {</pre>
             Dp[0][i].max\_len = 0;
             Dp[0][i].step = i ;
        for(int i = 0 ; i <= intX ; i++) {
             Dp[i][0].max\_len = 0 ;
             Dp[i][0].step = i ;
        Min\_step = 0;
        for(int i = 1 ; i <= intX ; i++) {</pre>
             for(int j = 1 ; j <= intY ; j++) {</pre>
                 if(strX[i-1] == strY[j-1]){
                      Dp[i][j].max_len = Dp[i-1][j-1].max_len +1;
                      Dp[i][j].step = Dp[i-1][j-1].step;
                      //cout << strX[i-1] << ' ' << strY[j-1] << ' ' << Dp[i][j].max_len << '\n'; //cout << strX[i-1] << ' ' << strY[j-1] << ' ' << Dp[i][j].step << '\n';
                      Dp[i][j].max_len = max(Dp[i-1][j].max_len , Dp[i][j-1].max_len );
                      Dp[i][j].step = min( min(Dp[i-1][j-1].step , Dp[i][j-1].step ) , Dp[i-1][j].step )
        cout << Dp[intX][intY].step << '\n';</pre>
    return 0;
```

### 1.2 Max 2D range sum

```
// Max 2D Range Sum - UVa 108 - solved with DP O(n^4).
// Abridged problem statement: Given an n x n square matrix of integers A where
// each integer ranges from [-127..127], find a sub-matrix of A with the maximum
#include <bits/stdc++.h>
using namespace std;
int A[200][200];
int main() {
  int n; scanf("%d", &n);
                                                       // square matrix size
  for (int i = 0; i < n; ++i)
for (int j = 0; j < n; ++j) {</pre>
       scanf("%d", &A[i][j]);
      if (i > 0) A[i][j] += A[i-1][j];
if (j > 0) A[i][j] += A[i][j-1];
                                                       // add from top
                                                       // add from left
      if (i > 0 && j > 0) A[i][j] -= A[i-1][j-1];// avoid double count
                                                       // inclusion-exclusion
  int maxSubRect = -127*100*100;
                                                       // the lowest possible val
  for (int i = 0; i < n; ++i)
  for (int j = 0; j < n; ++j)</pre>
                                                       // start coordinate
       for (int k = i; k < n; ++k)
        for (int 1 = j; 1 < n; ++1) {
  int subRect = A[k][1];</pre>
                                                        // end coord
                                                       // from (0, 0) to (k, 1)
           if (i > 0) subRect -= A[i-1][1];
           if (j > 0) subRect -= A[k][j-1];
           if (i > 0 && j > 0) subRect += A[i-1][j-1]; // O(1)
           maxSubRect = max(maxSubRect, subRect); // the answer is here
  printf("%d\n", maxSubRect);
  return 0;
```

## 1.3 Traveling salesman problem (TSP)

```
// This is a solution for UVa 10496 - Collecting Beepers. The problem is a // variant of the Traveling Salesman Problem (TSP): Given n cities and their // pairwise distances in the form of a matrix 'dist' of size n * n, compute the // minimum cost of making a tour that starts from any city s, goes through all // the other n - 1 cities exactly once, and finally returns to the city s. In // this case, the salesman is Karel in a 2D world who can only move along the // x and y axis. The cities are beepers whose coordinates are given, from which
```

```
// pairwise distances can be calculated. Algorithm takes time O(2^n * n^2).
// INPUT: The first line is the number of test cases. The first line of each
// test case is world's size (x-size and y-size). Next is the starting position
// of Karel. Next is the number of beepers. Next are the beepers' x- and y-
// OUTPUT: For each test case, output the minimum distance to move from Karel's
// starting position to each of the beepers and back to the starting position.
#include <bits/stdc++.h>
using namespace std;
#define LSOne(S) ((S) & -(S))
const int MAX n = 11;

```

### 5.5 Union-find disjoint sets (UFDS) by Bill

```
class UnionFind {
public:
    UnionFind(int N)
    {
       rank.assign(N, 0);
       p.assign(N, 0);
       for (int i = 0; i < N; ++i) p[i] = i;</pre>
```

#### 6 Utilities

#### 6.1 Bit manipulation

```
#define isOn(S, j) (S & (1<<j)) #define setBit(S, j) (S |= (1<<j)) #define (learBit(S, j) (S = ^{\circ} (1<<j)) #define toggleBit(S, j) (S ^{\circ} = (1<<j)) #define toggleBit(S, j) (S ^{\circ} ((-S)) #define lowBit(S) (S & (-S)) #define setAll(S, n) (S = (1<<n)-1)
```

### 6.2 C++ input output

```
#include <iostream>
#include <iomanip>
using namespace std;
    // Ouput a specific number of digits past the decimal point,
    cout.setf(ios::fixed); cout << setprecision(5);</pre>
    cout << 100.0/7.0 << endl;
    cout.unsetf(ios::fixed);
    // Output the decimal point and trailing zeros
    cout.setf(ios::showpoint);
    cout << 100.0 << endl;
    cout.unsetf(ios::showpoint);
    // Output a '+' before positive values
    cout.setf(ios::showpos);
    cout << 100 << " " << -100 << endl;
    cout.unsetf(ios::showpos);
    // Output numerical values in hexadecimal
    cout << hex << 100 << " " << 1000 << " " << 10000 << dec << endl;
```

#### 6.3 C++ STL

```
// Example for using stringstreams and next_permutation
#include <algorithm>
#include <iostream>
#include <stream>
#include <vector>

using namespace std;
int main(void) {
    vector<int> v;
    v.push_back(1);
```

```
v.push_back(2);
v.push_back(3);
v.push_back(4);
// Expected output: 1 2 3 4
                      4 3 2 1
do {
 ostringstream oss;
oss << v[0] << " " << v[1] << " " << v[2] << " " << v[3];
  // for input from a string s,
 // istringstream iss(s);
// iss >> variable;
  cout << oss.str() << endl;</pre>
} while (next_permutation (v.begin(), v.end()));
v.clear();
v.push_back(1);
v.push_back(2);
v.push back(1):
v.push_back(3);
// To use unique, first sort numbers. Then call
// unique to place all the unique elements at the beginning
// of the vector, and then use erase to remove the duplicate
// elements.
sort(v.begin(), v.end());
v.erase(unique(v.begin(), v.end()), v.end());
// Expected output: 1 2 3
for (size_t i = 0; i < v.size(); i++)
  cout << v[i] << " ";</pre>
cout << endl;
```

#### 6.4 Dates

```
// Routines for performing computations on dates. In these routines,
// months are expressed as integers from 1 to 12, days are expressed
// as integers from 1 to 31, and years are expressed as 4-digit
// integers.
#include <iostream>
#include <string>
using namespace std;
